

Work producing silica dust that is high risk

There are additional actions you must take if your work activity that produces silica dust is high risk.

For work activities producing silica dust that are high risk you must:

develop and use a silica risk control plan

provide crystalline silica training to workers at risk of exposure to silica dust

where required, do air monitoring for silica dust, and

report any exceedance of the workplace exposure standard for respirable crystalline silica to your WHS regulator, and

where required provide health monitoring for workers at risk of exposure to silica dust.

Your risk assessment will determine whether a work activity that produces silica dust is high risk.

Be silica smart

 **CLEAN AIR. CLEAR LUNGS.**

Not all workplace hazards are visible.
